

Satellite Channel Router SCR583T
 Because the switch is multi-standard it can be retrospectively fitted into existing systems without the need to enter the dwellings. Sky+ SCR enablement can then be carried out at a later date.

In order to make retrospective installations easier still the unit has been designed to accept a wide range of satellite input levels (60-90 dBuV) by the use of on-board automatic gain control (AGC) satellite amplifiers powered by the receiver. This removes the need for any user adjustable controls. Terrestrial signals are passed passively and may require separate amplification.

A simple splitter is the only item required within the users dwelling.
